

Environment

At Elite Precast Concrete we recognise the importance of making sustainable and ethical decisions.

This includes choosing materials that are responsibly sourced, energy efficient and environmentally friendly and manufacturing products with a long lifecycle and are re-cyclable or re-usable where possible.

As a manufacturer of precast concrete products, we follow and comply with the relevant codes of practice, legislation and guidance and are committed to reducing pollution and waste, whilst promoting recycling.

We maintain an environment management policy, which applies to all operations undertaken by us and is communicated to all staff, with copies available on the website.

Actions include:

- Protect and enhance the natural environment adjacent to or affected by our production.
- Measure, report and improve performance on environmental metrics.
- Develop products that improve the quality and sustainability of the built environment.
- Manage all waste streams effectively and minimise waste disposal to landfill.
- Minimise pollution and emissions associated with production and transportation.
- Use water and energy more efficiently, minimising demand on mains water and grid energy supplies.
- Use primary materials more efficiently (note – we do not use secondary materials).
- Operate in a responsible manner to protect employees, contractors and visitors.
- Liaise effectively with local communities to foster mutual understanding and respect.
